

DIOPSIS

INSECT
DETECTION

by Sina & Sami

Abstract

Insects are vital to ecosystems, but their populations are rapidly declining, threatening biodiversity. Traditional monitoring is slow and invasive, making data collection difficult. This project develops an AI system to automatically detect and identify insects from images, enabling faster and safer population monitoring.

Save Yourself!

we're killing them

Over 40% of insect species are in decline, with a third facing extinction

without them, we die

75% of Dutch food crops and 90% of wild plants depend on insects

Goal & Data

This project aims to build an intelligent AI model that can spot and classify different insect families from flower-screen images, using real data provided by HAS Green Academy. By comparing its performance with the existing Diopsis system, the project seeks to create a smarter, more efficient way to monitor insect biodiversity and support ongoing conservation efforts.
